APPLICATION NOTE

1. AM Low-Cut Circuit

- The AM Low-Cut action is carried out by the bypass of the high frequency component of the positive-feedback signal at the AF AMP stage. The external capacitor : C_3 by-pass this component.
- The cut-off frequency f_L is determined by the internal resistance $22\text{ k}\Omega$ (Typ.) and the external capacitor C_3 as following ;

$$f_L = \frac{1}{2 \times \pi \times 22 \times 10^3 \times C_3} \text{ (Hz)}$$

- In the case of the AM Low-Cut function is not needed, set up the value of C_3 over $1\ \mu\text{F}$. In the condition of $C_3 \geq 1\ \mu\text{F}$, the frequency characteristic has flat response at the low frequency.
- It is possible to reduce the recovered output level at AM mode, by additional resistance between the pin ③ and GND line.

2. FM Detection Circuit

For the FM detection circuit, detection coil is able to use instead of ceramic discriminator. Recommended circuit and recommended coil are as follows. (In this case, please take care that $V_{in}(\text{lim.})$ falls a little.)

TEST FREQUENCY	C_o (pF)	Q_o	TURNS				WIRE (mm ϕ)	REFERENCE

3. FM/AM switch and forced monaural switch.

- FM/AM switchover and stereo/forced monaural switchover are done by pin ⑬ and pin ⑭.
- FM/AM switch (pin ⑬)
 - (V_{13} : Low (Active Low, $V_{th} = 0.2\text{ V}$ (Typ.), $I_{th} 30\ \mu\text{A}$ (Typ.) \rightarrow AM)
